Stopping Long-Haul Covid

Long-haul Covid results from damage when the body goes into overdrive to attack the COVID-19 virus.

Dr. Darrell DeMello from India warns against allowing Covid to fester, allowing the virus to replicate by sending patients home and telling them to come back if they get breathless. He says, "it's not the virus that kills the patient, it's the body that kills the patient. It's the super overdrive of the immune response system which hits the cytokine storm, which sets up clotting." He says patients must be treated up front. If the management is done early and aggressively, says Dr. Mobeen Syed, long-haul Covid doesn't happen.

But even if there's damage, Dr. DeMello has eliminated much of the damage if it's within a few months of having the disease. So don't wait, at the beginning or after it's over. Start treatment right away.
